

Well-Appearing Infant 61-90 Days with Bronchiolitis

Infants with known bronchiolitis are low-risk

- The **AAP guideline** excludes infants with clinical bronchiolitis from their algorithms because they are lower risk
- **A review** (Ralston et al) of 11 studies of febrile infants with clinical bronchiolitis found no cases of meningitis
- **Data and analysis** from KPNC febrile infants seen in the ED from 2010-2019 found that of those age 61-90 days who were well-appearing and RSV+: *0/116 had bacteremia without meningitis*
0/116 had meningitis

Recommendation for this infant

- May go home without further testing
